### BAB I ALGORITMA BRUTE FORCE

#### **Deskripsi**

Word search puzzle adalah sebuah permainan kata yang mengharuskan pemain untuk menemukan kata yang tersembunyi dalam sebuah papan permainan yang berisikan huruf acak. Pada umumnya word search puzzle memiliki papan permainan yang berukuran persegi panjang (termasuk persegi). Dalam penyelesaiannya, word search puzzle merupakan sebuah permainan yang dapat dikomputasi untuk penyelesaiannya. Salah satu cara paling umum dalam menyelesaikan permainan ini adalah dengan menggunakan algoritma brute force.

#### **Algoritma Brute Force**

Pada dasarnya, algoritma *brute force* merupakan algoritma yang *straightforward*, dengan kata lain, penggunaannya dilakukan dengan Teknik yang sangat sederhana dan mudah dipahami. Berikut adalah Langkah-langkah algoritma *brute force* yang saya gunakan.

- 1. Karena ada 8 arah yang memungkin kata kunci ditemukan pada *puzzle*, maka pencocokan kata kunci akan dilakukan untuk 8 arah.
- 2. Mula-mula kata kunci yang dicari akan disejajarkan dengan awal matriks (pojok kiri atas) yang berisikan kata acak *puzzle*
- 3. Misalkan untuk arah kanan mendatar, akan dilakukan pembandingan karakter yang bersesuaian dimulai dari kiri ke kanan hingga:
  - Kata kunci memiliki kecocokan (berhasil)
  - Ada ketidakcocokan
- 4. Penelusuran akan dilakukan dari kiri ke kanan, jika sudah mencapai akhir matriks (pojok kanan bawah), maka pencocokan akan bergeser 1 langkah ke bawah dan diulang dari kiri ke kanan
- 5. Jika tidak ditemukan kecocokan hingga akhir matriks, maka program akan mengubah arah sesuai jarum jam (misalkan setelah kanan mendatar akan dilakukan pencocokan ke arah serong kanan bawah) dan mengulang kembali langkah 2.

\*notes: untuk arah selain kanan mendatar, pembandingan karakter dilakukan dengan mengikuti arah pencocokan tersebut, jika serong kanan bawah makan pembandingan karakter dilakukan secara serong kanan bawah.

## BAB II Source Code Program

Pada pembuatan algoritma, saya membagi program menjadi 3 bagian, yaitu file configuration, algoritma pencarian, main

#### 1. File configuration

Bagian ini berisikan program untuk membaca input teks dan mengassign teks tersebut menjadi map permainan dan kata kunci yang akan dicari. Secara garis besar, program akan membaca map terlebih dahulu. Ketika mendeteksi adanya line kosong maka program akan berhenti membaca map dan mulai membaca keyword.

```
#include "boolean.h"
#include <stdio.h>
#include <string.h>
#include <stdlib.h>
#include <time.h>
#define ROW_SIZE 50
#define COL_SIZE 50
typedef char ElType;
typedef struct {
    ElType contents[ROW_SIZE][COL_SIZE];
    int rowEff;
    int colEff;
} Matrix;
#define ROW(M) (M).rowEff
#define COL(M) (M).colEff
#define ELMT(M, i, j) (M).contents[(i)][(j)]
typedef struct {
    ElType contents[50][50];
    int neff;
} List;
#define NEFF(L) (L).neff
#define ELMTL(L, i) (L).contents[(i)]
Matrix map;
Matrix result;
List words;
char fileName[50];
```

```
int count = 0;
void file_config(){
    printf("Input nama file: ");
    scanf("%s", &fileName);
    FILE* fp = fopen(fileName, "r");
    char c = fgetc(fp);
    char currc = c;
    ROW(map) = 0;
    COL(map) = 0;
    int brs = 0;
    int kol = 0;
    while (c!='\n' || currc!='\n'){
        if ((c!=' ') && (c!='\n')){
            ELMT(map, brs, kol) = c;
            kol++;
        if (c=='\n'){
            ROW(map)++;
            brs++;
            COL(map) = kol;
            kol = 0;
        currc = c;
        c = fgetc(fp);
    ROW(result) = ROW(map);
    COL(result) = COL(map);
   NEFF(words) = 0;
    char line[50];
    while (fgets(line, sizeof(line), fp)){
        strcpy(ELMTL(words, NEFF(words)), line);
        NEFF(words)++;
    for (int i = 0; i < NEFF(words)-1; i++){
        ELMTL(words, i)[strlen(ELMTL(words, i))-1] = '\0';
    fclose(fp);
```

#### 2. Algoritma pencarian

Bagian ini berisikan program algoritma *bruteforce* untuk mencocokan kata kunci dan memiliki 8 subprogram, yaitu pencarian sesuai dengan 8 arah kemungkinan kata kunci ditemukan

```
boolean search_east(int n){
    int currLen = strlen(ELMTL(words,n));
    for (int i = 0; i < ROW(map); i ++){}
        for (int j = 0; j < COL(map); j++){
            int m = 0;
            count++;
            while ((m<currLen)&&(ELMT(map,i,j+m)==ELMTL(words,n)[m])){</pre>
                 count++;
            if (m==currLen){
                 for (int a = 0; a <ROW(result); a++){</pre>
                     for (int b = 0; b<COL(result); b++){</pre>
                         ELMT(result, a, b) = '-';
                while (m != 0){
                     ELMT(result, i, j)=ELMT(map, i, j);
                     j++;
                     m--;
                for (int i = 0; i < ROW(map); i++){}
                     for (int j = 0; j < COL(map); j++){
                         printf("%c ",(ELMT(result, i, j)));
                     printf("\n");
                printf("\n");
                 return true;
        }
    return false;
boolean search_southeast(int n){
    int currLen = strlen(ELMTL(words,n));
```

```
for (int i = 0; i < ROW(map); i ++){
        for (int j = 0; j < COL(map); j++){
            int m = 0;
            count++;
            while ((m<currLen)&&(ELMT(map,i+m,j+m)==ELMTL(words,n)[m])){</pre>
                m++;
                count++;
            if (m==currLen){
                 for (int a = 0; a <ROW(result); a++){</pre>
                     for (int b = 0; b<COL(result); b++){</pre>
                         ELMT(result, a, b) = '-';
                while (m != 0){
                     ELMT(result, i, j)=ELMT(map, i, j);
                    j++;
                     m--;
                for (int i = 0; i < ROW(map); i++){
                     for (int j = 0; j < COL(map); j++){}
                         printf("%c ",(ELMT(result, i, j)));
                     printf("\n");
                printf("\n");
                return true;
    return false;
boolean search_south(int n){
    int currLen = strlen(ELMTL(words,n));
    for (int i = 0; i < ROW(map); i ++){
        for (int j = 0; j < COL(map); j++){}
            int m = 0;
            count++;
            while ((m<currLen)&&(ELMT(map,i+m,j)==ELMTL(words,n)[m])){</pre>
                m++;
                count++;
            if (m==currLen){
```

```
for (int a = 0; a <ROW(result); a++){</pre>
                     for (int b = 0; b<COL(result); b++){</pre>

```

#### 3. main

File ini berisikan algoritma program utama yang memanggil fungsi pembacaan file, algoritma *brute force* pencocokan serta output hasil, waktu, serta jumlah perbandingan ke layer. Perlu diperhatikan, waktu yang digunakan adalah asumsi program pada device yang penulis gunakan menggunakan satuan ms. Waktu yang diberikan adalah waktu running program secara keseluruhan. Jumlah perbandingan kata yang penulis gunakan adalah operasi perbandingan yang dilakukan program hingga semua kata selesai diproses.

```
int main(){
    file_config();
    printf("\n");
    printf("berikut adalah puzzle yang akan diselesaikan: \n");
    for (int i = 0; i <ROW(map); i++){
        for (int j = 0; j<COL(map); j++){
            printf("%c ",(ELMT(map, i, j)));
        }
        printf("\n");
    }
    printf("\n");
    for (int i = 0; i <= NEFF(words); i++){
        printf("%s\n", ELMTL(words, i));
    }
}</pre>
```

```
}
clock_t start_time = clock();
for (int n = 0; n < NEFF(words); n++){
    search_east(n);
    search_north(n);
    search_northeast(n);
    search_south(n);
    search_south(n);
    search_southeast(n);
    search_southwest(n);
    search_west(n);
}
clock_t end_time = clock();
printf("Jumlah perbandingan kata yang dicari: %d", count);
printf("\n");
    double total = end_time-start_time;
    printf("Waktu running algoritma: %f detik", total/1000);
}
</pre>
```

#### 4. boolean.h

File ini berisikan struktur data baru, yaitu boolean

```
/* Definisi type boolean */
#ifndef _BOOLEAN_h
#define _BOOLEAN_h

#define boolean unsigned char
#define true 1
#define false 0
#endif
```

### **BAB III**

## Input dan Output

Pada input dan output ini, program saya sengaja dibatasi untuk jumlah kata yang dicari tidak terlalu banyak karena jumlah kata yang akan dicari hanya diassign maksimal 50 dan juga karena keterbatasan pada terminal (dan menghemat space pada laporan), pada bagian pengujian large akan terpotong beberapa bagian (tidak semuanya ditampilkan).

```
Contoh 1(default):
Input nama file: test.txt
berikut adalah puzzle yang akan diselesaikan:
JSOLUTIS
SUNARUUA
NEPTUNET
SONIEISU
RCEVTRER
AHTRAESN
MMERCURY
berikut adalah kata yang akan dicari:
EARTH
JUPITER
MARS
MERCURY
NEPTUNE
SATURN
URANUS
VENUS
 HTRAE-
```

]
- U
P
I
T
E
R -

### Contoh 5(medium):

```
Input nama file: test5.txt

berikut adalah puzzle yang akan diselesaikan:
P X I G V J F D M B J O G S T T F C
W E T H C U Q S N W K E A U X E E B
C B N Q Q S P V B L P G J L F P C
B E E S N N D T R A I T A N L I Y R
J Q R Z I F C S S K W Q L E N C F C

P F O H C E X G J L J R P H U F Q P
V C W X Q U J E I U Z W K L H P D Y
D C G M D R J Y A E I C S E H J C V

berikut adalah kata yang akan dicari:
BOLPEN
BOTOL
GALON
GELAS
KARPET
KIPAS
PENSIL
```
